LASER TREATMENT

Laser Hair Removal

Undesired body and facial hair can be done away with once and for all with modern treatments. Cutting technology Laser is used remove any unwanted hair. In our centre, laser hair removal is done for all skin types with advanced technology of Deka nd yag + Alexandrite + IPL. The post operative cooling involves no pain.

How it works:

Deka nd yag + Alexandrite+ IPL for all skin types and fine hair, cooling with no pain.	
Ultimate hair Removal performance with Nd:YAG and Alexandrite with additional IPL capabilities in one system is now one of the most favored technologies for hair removal. Multi-Platform laser for premium hair removal with dual wavelength of either Alexandrite or Nd:YAG, or both combined.	
Features :	
Two wavelengths for premium hair removal	
Perform high quality vascular treatments with Nd:YAG laser source	
One of highest powered Nd:YAG systems	
The best Performance	

High quality IPL light source for additional treatments
Fine hair removal

CO₂ LASER

CO₂RE

Fractional CO₂ Resurfacing

CO₂RE is the versatile fractional CO₂ system that enables you to precisely target and effectively treat the skin's surface, middle, and deep dermal levels. Then seamlessly perform traditional [CO₂resurfacing](#) and laser excision of lesions.

CO₂RE gives you the ability to treat both superficial and deep skin layers simultaneously with precision-control over the intensity, pattern, and depth of ablation.

With CO₂RE laser skin resurfacing treatment, patients experience improvement in:

- Skin tone and texture
- Sun-damaged skin

- Age spots
- Fine lines and wrinkles
- scars

FACIAL

ULTHERAPY

ULTHERAPY® is a non-invasive face and upper neck treatment utilizing ultrasound energy along with your body's own natural healing process to lift, tone, and tighten loose skin. Many patients notice a tightening "boost" immediately coupled with the gradual process of creating new skin-firming, collagen over three to six months.

After just ONE treatment, with no surgery, your skin gradually develops a refreshed, firmer, and more youthful appearance.

FREQUENTLY ASKED QUESTIONS

HOW DOES ULTHERAPY WORK?

All the support of your skin lies in the deepest layers. Ultherapy focuses ultrasound energy into these layers, which respond by instantly tightening the tissue and gradually creating new collagen. By harmlessly passing through the thinner surface skin, Ultherapy avoids the prolonged downtime typical of other nonsurgical “lifts.”

WHO IS A CANDIDATE FOR ULTHERAPY?

A good candidate is someone whose skin is losing its firmness, especially around the jaw line and upper neck areas. Our patients are typically between the ages of 35-65 with mild to moderate skin laxity. The only patients who cannot be treated are pregnant or lactating women.

HOW SOON WILL I SEE RESULTS?

You may notice toning and firming immediately, but the full lifting and tightening effect will gradually build over the course of three to six months. **A variety of factors can affect your response, and your provider will discuss these with you.**

HOW LONG DO THE RESULTS LAST?

Results are proven to last well over a year since new, healthy collagen has been established (in our experience, many patients continue to benefit beyond 2 years). Of course, your skin does continue to age during this time, so you will benefit from yearly touch-up treatments to help slow down the aging process. Patients typically return for a treatment once every 12-18 months.

DOES ULTHERAPY HURT?

Most describe the sensation as akin to a snap from a rubber band. The sensation is temporary, and a sign that the collagen-building process has been initiated. If you have any concerns regarding pain, our providers will be glad to discuss a variety of pain management options with you. Patients typically leave the office comfortable and excited to see the results!

BODYCONTOURING /Slimming machines

Ultracontour by Medix System

Ultracontour® generates high power acoustic waves that are precisely localized and controlled in amplitude. It guarantees an improved degree of reliability and safety, taking into account the use of a larger amount of electrical and acoustic energy. UMD® multi-sequential ultrasound waves have been specifically developed to directly target the fat cells and promote the lymphatic drainage of the fluids and the waste immediately after HIFU session.

Totally non-invasive body contouring.

Localized fat treatment system, such as Lipodistrophy.

Latest therapeutic ultrasound technology.

A unique method based on combined therapy (HIFU + UMD®).

Engineering based on long term therapeutic ultrasound experience.

User friendly with TFT touch screen available.

Software Assistance during protocols to guide Physicians in real time during both treatments.

No down time for your patients: they can resume their normal activities immediately after treatment.

Ultracontour® is unique and patented: it is the first device in the world to offer dual ultrasound options to the Physicians.

Tri Active by Deka

It is the most advanced skin tightening device. Using three contemporary technologies together; laser, ultrasonic and vacuum, this new device has found an answer to cellulite treatment, Rejuvenation, restoring skin glow and elasticity.

The multipronged action includes:

- Six laser diodes which stimulate microcirculation and neoangiogenesis, in particular at an infradermic level;
- A localized cooling system which can quickly reduce edematous collections;
- A rhythmical intake massage which can stimulate the lymphdraining pump

This progressive stimulating and massaging action on the connective and adipose tissue allows physiological reactivation of the biological mechanisms for wastes' elimination and tissue oxygenation, restoring a harmonic alignment of the connective tissue.

LIPOCRYO

Lipocryo is a precisely controlled process using the technology of cryolipolysis that simply targets, cools, and eliminates fat cells without damage to the surrounding skin and tissues. After one treatment, your body will naturally eliminate these crystallized fat cells after they are broken down.

Depending on the thickness of the fat tissues and the desired result, 1 to 3 sessions may be required. Ideally, the interval between sessions is about 45 days. Depending on the initial adipose tissue thickness, the average percentage fat loss will be 20%. Some results may be visible after 15 days, but usually a period of 6 weeks is required for the main results to show. This will be the point of time to determine whether another session is necessary. The ideal candidate is not the obese patient, but one who wants to reduce fat around specific areas, such as on the abdomen, flanks, lower back, arms. The procedure is not painful. A slight pulling tension can be felt close to the treated area due to the suction effect, followed by an intense cold sensation around the area, mainly at the beginning of the procedure. After the session, there will be some redness and numbness on the treated area which can last a couple of hours after the session. Some candidates may have slight bruises that will reside within a few days. The patient can resume to normal activities immediately after the treatment without any discomfort.

FACIAL

Micro Dermabrasion facial (Crystal)

This aesthetic procedure is yet another way to look younger. Crystal peeling removes aged skin cells with the special crystals and smoothens out wrinkles and fine lines. Scars left from wounds or chicken pox can be minimized to a great extent. It generally makes the skin clean and helps it breathe well by unclogging pores, stimulating the circulation of the skin, eliminating dead skin cells from the top layer of the skin and thus improving the skin's ability to retain moisture, giving it a more youthful and healthy appearance. Greasy and problematic skin becomes clean and clear. Ageing or dead cells are exfoliated making you look younger.

Aesthetic Fillers

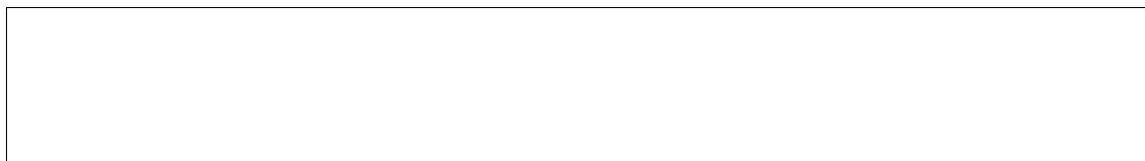

General Plastic and Reconstructive Fillers help to give the face or body the desired curves and also make you look younger. The reconstructive fillers are used to sculpt and give fine look for lips, breasts and hips. Plastic surgery can fix any bump or dent in the nose, redefine a slack jaw line, smoothen out wrinkles and crows feet. Fillers can also lift sagging brows, and improve the lines in the neck and mouth.

Lips can be beautifully sculpted with fillers, can be made to look fuller and also enhance the lip border. The whole procedure doesn't need long periods in the hospital and is absolutely safe. Different kinds of fillers are available like injectibles, Botox, Collagen Restylane etc. Each has its own set of advantages and disadvantages. The results last longer in some while in others, you need frequent follow-ups.

BOTOX

BOTOX® Cosmetic is a prescription medicine that is injected into muscles and used to improve the look of moderate to severe frown lines between the eyebrows (glabellar lines) in adults younger than 65 years of age for a short period of time (temporary).

BOTOX® Cosmetic is a prescription medicine that is injected into the area around the side of the eyes to improve the look of moderate to severe crow's feet lines in adults for a short period of time (temporary).

****SURGICAL****

Rhinoplasty

Rhinoplasty is commonly known as the nose job. Done as a cosmetic as well as a corrective procedure, it requires real finesse and expertise to do a good job. As the surgery involves cartilages and soft tissues, great care has to be taken to deliver to the satisfaction of the patient.

Congenital deformities, mutilation, accident scars can all be corrected to a great extent by the advanced procedures in rhinoplasty. The open procedure helps reconstruct the nose in a more aesthetic manner. This is preferred as the secondary rhinoplasty may be avoided with the procedure.

Rhinoplasty procedures include:

Narrowing of the nasal bridge

Hump reduction

Narrowing of the width of the nostril

Straightening the nose

Refining the nasal tip

Changing the angle between the nose and the mouth

Correction of a nasal septum deviation to improve nasal breathing

New techniques employed to keep post operative oedema or blue discolouration to minimum.

Otoplasty

Otoplasty is the reconstruction of the outer ear. Ears may be cosmetically enhanced or corrected by this simple procedure. Like Rhinoplasty, otoplasty too has to be done with utmost care. Otoplasty surgery can involve a combination of moving, reshaping, adding, or removing structural ear elements.

Otoplasty Procedures include:

Bringing the ears closer to the head (often called ear pinning)

Reducing the size of very big ears

Reshaping various bends in the cartilage

Reconstructive procedures deal with the deformed, or absent (microtic) ears

Face Lift

With advancing age, facial muscles tend to become flaccid thereby giving the face a sagging look. This can be corrected with modern techniques that have side effects. Face lifts makes one look younger and trimmer.

The face lift, technically known as a rhytidectomy, is among the most popular procedures in cosmetic surgery. Earlier only tightening of the skin was done but today it includes more comprehensive lifting and shaping of the layers of the skin, tissue, and muscle. The incisions are so well hidden that even a close up does not reveal them. The results tend to be more natural, causing patients to look refreshed, rather than surgically altered.

Men and women who choose this surgical procedure aimed at reducing visible signs of aging, such as creases in the face, slackness in the jawline and accumulation of fat around the neck, have options beyond the traditional face lift.

LIPOSUCTION USING SMART LIPO

Liposuction slims and reshapes specific areas of the body by removing excess fat deposits and improving your body contours and proportion.

Liposuction techniques may be used to reduce localized fat deposits of the:

- Thighs
- Hips and buttocks

- Abdomen and waist
- Upper arms
- Back
- Inner knee
- Chest area
- Cheeks, chin and neck
- Calves and ankles

Liposuction is not a treatment for obesity or a substitute for proper diet and exercise.

WHAT IS SMART LIPO

Smartlipo™ Laser Body Sculpting Workstations provide aesthetic surgeons with a less invasive technique than conventional liposuction methods for fat reduction and body toning. It is designed to destroy fat cells and coagulate tissue for tighter skin, Smartlipo is ideal for treating localized fat deposits on the face and body.

In addition, Smartlipo laser lipolysis systems can easily treat challenging areas—such as regions of high vascularity and flaccidity. It can also be used for tightening of face, breast or buttocks and for the reduction of pregnancy fat or weight loss striae.

Abdomenoplasty or Tummy tuck

Abdomenoplasty or Tummy tuck is a surgical procedure to reduce fat and sagging skin around the tummy. Removes excess fat and skin and, in most cases, restores weakened or separated muscles creating an abdominal profile that is smoother and firmer.

It also removes scars from pregnancy too. There are two types of Tummy tuck procedures. The full Tummy involves a complete redo of the tummy where the belly button has to be recreated. The half Tummy tuck or Partial abdomenoplasty is done for the lower abdomen and is a less complex surgery.

Abdomenoplasty is advised when you have:

Excess or sagging abdominal skin

An abdomen that protrudes and is out of proportion to the rest of the body

Abdominal muscles that have been separated and weakened

Excess fatty tissue that is concentrated in your abdomen

Extended abdomenoplasty is a complete abdomenoplasty plus a lateral thigh lift. The resulting scar runs from the posterior axillary line (when placing your open hands on your hips, the thumbs lie along the posterior axillary line). The operation does all of the abdominal contouring of a

complete abdomenoplasty plus allows further improvement of the flank (waist), as well as smoothing the contour of the upper lateral thigh.

Blepharoplasty

It is one of the most opted for cosmetic procedures. Blepharoplasty is a surgery by which droopy or saggy eye lid or bags around the eye can be corrected. Upper and lower eye lid can be corrected simultaneously and the procedure rejuvenates the eye. Protruding fat and excess skin can be addressed simultaneously by excision. It can also be done to create a crease in lid, supratarsal fold which may be absent in some especially people from East and South East Asia.

BREAST AUGMENTATION

Breast augmentation surgery also known as augmentation mammoplasty is the surgical placement of breast implants to increase fullness and improve symmetry of the breasts or to restore breast volume lost after weight reduction or pregnancy.

Breast augmentation can:

- Increase fullness and projection of your breasts
- Improve the balance of your figure
- Enhance your self-image and self-confidence

BREAST REDUCTION

Also known as reduction mammoplasty, breast reduction surgery removes excess breast fat, glandular tissue and skin to achieve a breast size in proportion with your body and to alleviate the discomfort associated with overly large breasts.

BUTTOCK AUGMENTATION

Buttock augmentation surgery, sometimes referred to as a Brazilian butt lift when fat transfer is involved, uses implants, fat grafting or sometimes a combination of both to increase the size of your buttocks.

This procedure can:

- Increase fullness, roundness and projection of your buttock
- Improve the balance of your figure
- Enhance your self-image and self-confidence

Buttock augmentation surgery is right for someone who does not like the shape of their buttock or is looking to balance their body. It is commonly performed in one of two ways, with implants or fat transfer. The fat transfer procedure is commonly known as a "Brazilian butt lift."
